Package 'FastStepGraph'

October 12, 2023

Type Package

Title A Fast Algorithm for Sparse Precision Matrix Estimation

Version 0.1.1

Maintainer Juan G. Colonna <juancolonna@icomp.ufam.edu.br>

Description It implements an improved and computationally faster version of the original Stepwise Gaussian Graphical Algorithm for estimating the Omega precision matrix from high-dimensional data. Zamar, R., Ruiz, M., Lafit, G. and Nogales, J. (2021) <doi:10.52933/jdssv.v1i2.11>.

R topics documented:

`cv.FastStepGraph` *Searches for the optimal combination of alpha_f and alpha_b parameters using Cross-Validation*

Description

`cv.FastStepGraph` implements the cross-validation for the Fast Step Graph algorithm.

Usage

```
cv.FastStepGraph(
  x,
  n_folds = 5,
  alpha_f_min = 0.2,
  alpha_f_max = 0.8,
  b_coef = 0.5,
  n_alpha = 32,
  nei.max = 5,
  data_scale = FALSE,
  data_shuffle = TRUE,
  max.iterations = NULL,
  return_model = FALSE,
  parallel = FALSE,
  n_cores = NULL
)
```

Arguments

`x`	Data matrix (of size n x p).
`n_folds`	Number of folds for the cross-validation procedure (default value 5).
`alpha_f_min`	Minimum threshold value for the cross-validation procedure (default value 0.2).
`alpha_f_max`	Minimum threshold value for the cross-validation procedure (default value 0.8).
`b_coef`	This parameter applies the empirical rule alpha_b=b_coef*alpha_f during the initial search for the optimal alpha_f parameter while alpha_b remains fixed, after finding optimal alpha_f, alpha_b is varied to find its optimal value. The default value of b_coef is 0.5.
`n_alpha`	Number of elements in the grid for the cross-validation (default value 32).
`nei.max`	Maximum number of variables in every neighborhood (default value 5).
`data_scale`	Boolean parameter (TRUE or FALSE), when to scale data to zero mean and unit variance (default FALSE).
`data_shuffle`	Boolean parameter (default TRUE), when samples (rows of X) must be randomly shuffled.
`max.iterations`	Maximum number of iterations (integer), the defaults values is set to p*(p-1).

return_model	Default FALSE. If set to TRUE, at the end of cross-validation, FastStepGraph is called with the optimal parameters alpha_f and alpha_b, returning vareps, beta, Edges and Omega.
parallel	Boolean parameter (TRUE or FALSE), when to run Cross-Validation in parallel using a multicore architecture (default FALSE).
n_cores	An 'int' value specifying the number of cores do you want to use if 'parallel=TRUE'. If n_cores is not specified, the maximum number of cores on your machine minus one will be set automatically.

Value

A list with the values:

alpha_f_opt	the optimal alpha_f value.
alpha_f_opt	the optimal alpha_f value.
CV.loss	minimum loss.

If return_model=TRUE, then also returns:

vareps	Response variables.
beta	Regression coefficients.
Edges	Estimated set of edges.
Omega	Estimated precision matrix.

Author(s)

Prof. Juan G. Colonna, PhD. <juancolonna@icomp.ufam.edu.br>

Prof. Marcelo Ruiz, PhD. <mruiz@exa.unrc.edu.ar>

Examples

```
data <- FastStepGraph::SigmaAR(30, 50, 0.4) # Simulate Gaussian Data
res <- FastStepGraph::cv.FastStepGraph(data$X, data_scale=TRUE)
```

FastStepGraph *Fast Stepwise Gaussian Graphical Model*

Description

Improved and faster implementation of the Stepwise Gaussian Graphical Algorithm.

Usage

```
FastStepGraph(
  x,
  alpha_f,
  alpha_b = NULL,
  nei.max = 5,
  data_scale = FALSE,
  max.iterations = NULL
)
```

Arguments

x	Data matrix (of size n_samples x p_variables).
alpha_f	Forward threshold (no default value).
alpha_b	Backward threshold. If alpha_b=NULL, then the rule alpha_b <- 0.5*alpha_f is applied.
nei.max	Maximum number of variables in every neighborhood (default value 5).
data_scale	Boolean parameter (TRUE or FALSE), when to scale data to zero mean and unit variance (default FALSE).
max.iterations	Maximum number of iterations (integer), the defaults values is set to p*(p-1).

Value

A list with the values:

vareps	Response variables.
beta	Regression coefficients.
Edges	Estimated set of edges.
Omega	Estimated precision matrix.

Author(s)

Prof. Juan G. Colonna, PhD. <juancolonna@icomp.ufam.edu.br>

Prof. Marcelo Ruiz, PhD. <mruiz@exa.unrc.edu.ar>

Examples

```
data <- FastStepGraph::SigmaAR(30, 50, 0.4) # Simulate Gaussian Data
G <- FastStepGraph::FastStepGraph(data$X, alpha_f = 0.22, alpha_b = 0.14, data_scale=TRUE)
```

SigmaAR *Simulate Covariance Matrix with an Auto-regressive (AR) Model*

Description

Helper function to simulate Simulate Gaussian Data with an Autoregressive (AR) Model

Usage

```
SigmaAR(n_rows, p_columns, phi)
```

Arguments

n_rows	Number of samples (rows of X).
p_columns	Number of variables (columns of X).
phi	Auto-regression coefficient.

Value

A list with the values:

Sigma	A covariance matrix.
Omega	A precision matrix.
X	A normalized data matrix with Gaussian distribution.
